*Synonyms: abs; rectus abdominis muscle; straight abdominis muscle; six pack; six-pack; sixpack; rectus*

not final

## Summary

The *Musculus rectus abdominis*, often referred to as "**abs**" (short for "abdominal muscles"), sits in front of your stomach and is visible on trained and **low body fat** people. In fact, there are two individual muscle cords right next to each other (that's why I'll refer to them in plural). Besides being used for **breathing** the muscles also **bend the torso and lift the pelvis forward** - thus the abs are the main antagonist of the **spine stretcher** (*M. erector spinae*). There are **tendons that separate the long muscle cords into packs** for better muscle contraction precision.

What is the most relevant information that everyone needs to know?

Try to include the full latin name, where the muscle is, what it does and whats significant about it.

## Visual Introduction

Introduce the muscle in a visual way.

*\*insert drawings that harmonize well with the summary\**

## Origin

- Cartilage of the **5th, 6th and 7th rib** (there is cartilage at the front tip of each rib)
- Some muscle fibers connect to the **breastbone (Sternum)**

## Insertion

- Pubic bone (*Os pubis*), more specifically on the **superior pubic ramus** (*Ramus superior*; ramus = branch)
- **Pubic symphysis** (*Symphysis pubica*), that's the cartilage between the two pubic bones

*\*insert drawing for origin and insertion\**

Ideally in one picture

## Functions

- Bending and crunching the torso forward; the familiar "**sit up**" **motion** represents this function pretty well
- **Lifting/twisting the pelvis forward**
- Breathing control; the abs are used mainly for **exhaling**

What is this muscle used for?

## Different Viewpoints

You can work with simplified shapes so that other artists can memorize more information. You can also go more detailed, if that's what you prefer.

*\*insert drawings where the muscle can be seen from different viewpoints\**

You can also include drawings that visualize the functions mentioned before

## Details

### Everything beyond the basics

The tendinous intersections (*Intersectiones tendineae*) determine how many packs you can have. Most people (around 60%) have 3 intersections which equals 6 possible packs. In some media you see people with 8 packs to empathize their strength. In reality only 20% even have 4 intersections = 8 packs, which means it's based on luck (genetics) if you are even able to develop an 8 pack.

What is also important if one wants to study this muscle beyond the basics?  
Go over the muscle more in detail and share intermediate up to expert knowledge.  
This part is collapsed at first, because we don't want to scare the reader with too much text.

*\*insert drawings if needed for explanation\**

## Reference Pictures (for study only)

**Name the source (website) here**

This part is collapsed at first, so that the images won't load when opening the article.

*\*insert real life pictures\**
